Double cableway – double fun

Two children can slide parallelly and enjoy together the emotional sensation of speed.

Cableway system composed of a departure structure and an arrival structure. The higher departure structure consists of a wide platform which can be ascended by an inclined ramp. The arrival structure is built of a quadrupedal frame, equipped with a braking system for the cableway trolleys. Both structures, mounted 25m from each other, are connected with two parallel steel cables that serve as rails for the cableway trolleys and at a distance of 2m between both cables.
